

Tyra K. Javed

Mumbai, India | tyra191712@gmail.com | +91-8928817540 | [linkedin.com/in/tyraakj](https://www.linkedin.com/in/tyraakj) | github.com/tyraakj

Professional Summary

Backend-focused developer experienced in building distributed systems, smart contracts, and AI-integrated platforms. Delivered production Spring Boot services with Kafka event streaming, rate limiting, and circuit breakers, alongside gasless Web3 escrow contracts on Base. Pursuing BCA at Somaiya Vidyavihar University (GPA: 10.0/10.0); seeking internships in backend or full-stack engineering roles.

Education

Bachelor of Computer Applications (BCA) | GPA: 10.0 / 10.0

2025 – 2028

Somaiya Vidyavihar University, Mumbai

Skills

Languages: JavaScript / TypeScript, Java, Python, SQL, MySQL, PostgreSQL

Frameworks & Libraries: React, Spring Boot, Spring Web MVC, Spring Security, Spring Data JPA, Hibernate

AI & Data: IBM watsonx.ai (Llama 3 70B), Apache Kafka, Redis, Supabase, NeonDB, Streamlit

Infrastructure & Tools: AWS S3, Railway, Vercel, Docker, Bucket4j, Resilience4j, JavaParser (AST), Git, GitHub

Blockchain: Solidity, OpenZeppelin, ethers.js, ERC-3009, Base

Experience

Data Analyst | GarunaCDX

March 2026 – April 2026

Remote

Built a Streamlit analytics dashboard tracking job listing metrics across 200+ records scraped from multiple job platforms, enabling the team to monitor posting trends and activity in real time.

Integrated Supabase as the backend data store, structuring and querying job data to power live dashboard visualizations.

Backend Developer | NexKirana

January 2026 – March 2026

Remote

Refactored authentication layer from JWT to JWE (JSON Web Encryption) in a Node.js environment, encrypting token payloads to prevent sensitive user data exposure in transit.

Improved API security posture by ensuring all auth tokens carried encrypted claims, reducing risk of payload interception.

Projects

API Guardian | Production-Hardened API Gateway

Spring Boot, Apache Kafka (KRaft), Redis, React, TypeScript, AWS S3, Resilience4j, Bucket4j

Built a non-blocking reverse proxy on Spring WebClient with bounded connection pool, hard connect/read timeouts, and token-bucket rate limiting per client IP via Bucket4j + Redis.

Implemented async Kafka event streaming so every proxied request is published without blocking the request thread; consumers apply UUID-based dedup (Redis SET NX) for replay-safe analytics counters.

Engineered real-time SSE dashboard over React — zero polling; daily analytics archived to AWS S3 with Spring Retry and Kafka DLQ on failure.

Added Resilience4j circuit breakers on Redis and S3 with fail-open degradation; JWT auth with Redis blacklist for immediate token revocation on logout.

Vaulted | Gasless Freelance Escrow on Base Sepolia

React, TypeScript, Solidity, OpenZeppelin, ethers.js, UGF SDK, Base Sepolia Testnet

Built a decentralised escrow platform where payment locks on-chain at job creation and releases only on client approval — eliminating platform middlemen and the 20% Fiverr/Upwork cut.

Integrated UGF (Universal Gas Framework) 4-step gasless flow: wallet login → USD quote → ERC-3009 signature → UGF executes on-chain; freelancers need zero ETH.

Authored Escrow.sol on OpenZeppelin with 7-day auto-release (anti-hostage), on-chain caller identity enforcement, and dispute state machine: Open → Active → Complete → Released / Disputed.

Architected 'read with ethers, write with UGF' separation across custom hooks (useWallet, useUGF, useContract) to prevent MetaMask from demanding native gas on any write path.

CodeSheriff | AI-Powered Code Security Platform

Spring Boot, React, IBM watsonx.ai (Llama 3 70B), PostgreSQL/Supabase, JavaParser, JWT, Bucket4j

Architected a 4-layer security pipeline — prompt injection detection (20+ patterns), credential leak scanning (13 secret types incl. AWS/GitHub/JWT), AI hallucination validation via AST diff, and immutable audit trail.

Integrated IBM watsonx.ai for method-level Java analysis: cyclomatic complexity, test coverage suggestions, and confidence scoring with AST-level validation against JavaParser output to catch hallucinations.

Designed enterprise features: multi-tenant row-level security, JWT auth, 100 req/min token-bucket rate limiting, paginated REST API across 11 endpoints, and 8 JPA entities across 8,371 lines of production code.

Certifications

Machine Learning with Python | IBM Skills Network

October 2025

Introduction to Software Engineering | IBM

November 2025

Oracle Java Foundations | Oracle

November 2025

Extracurricular

Participant | Winter of Code 5.0

December 2025 – January 2026

GDG on Campus, IIIT Kalyani

Contributed an authentication service feature to an open-source project in Node.js as part of a national open-source program run by Google Developer Groups on Campus.

Collaborated with maintainers and peer contributors across the month-long program, gaining hands-on experience with open-source workflows, code review, and collaborative development.
